

Graph (e): Cross-Chain Research Output by Category, 2018-2025

Annual publication counts across six research categories, bibliometrically aggregated across IEEE Xplore, ACM DL, Springer, USENIX, arXiv, and Google Scholar.

Methodology / notes

Annual counts are bibliometric estimates anchored to direct arXiv strict-phrase searches and scaled by a conservative venue-coverage factor (~2.5-4x) to approximate the union of IEEE Xplore, ACM DL, Springer Nature, USENIX, arXiv (cs.CR + cs.DC), Google Scholar, and DBLP after DOI / arXiv-id deduplication. The State-Driven Approaches row stays in single digits throughout the window, providing the bibliometric signal of the research gap this paper addresses.

Graph (e): Cross-Chain Research Output by Category, 2018-2025
Data table (values plotted in the graph)

Category	2018	2019	2020	2021	2022	2023	2024	2025
HTLC-style atomic swaps	8	11	14	16	18	17	14	11
Adaptor / scriptless swaps	2	4	8	14	22	30	38	44
Bridges (custodial / relay)	3	6	10	18	35	48	46	42
Light clients / SPV / relays	4	5	7	10	12	15	18	22
ZK bridges / zk-relays	0	0	1	3	9	18	28	35
State-Driven Approaches (gap)	1	1	2	2	3	3	4	5
Annual total	18	27	42	63	99	131	148	159
